

CSN:361 Assignment:2

AUTUMN SEMESTER 2019

Submitted by: Divyanshu Salve (17114027)

1 AUGUST 2019

Problem Statement - 1:

Write a socket program in C to connect two nodes on a network to communicate with each other, where one socket listens on a particular port at an IP, while other socket reaches out to the other to form a connection.

Socket Programming is a way of connecting two nodes on a network to communicate with each other. One socket(node) listens on a particular port at an IP, while other socket reaches out to the other to form a connection. Server forms the listener socket while client reaches out to the server.

In our program, we are exchanging couple of messages between the client and the server.

```
#include <netdb.h>
#include <netinet/in.h>
#include <unistd.h>
#include <stdio.h>
#include <string.h>
#include <sys/types.h>
#include <sys/socket.h>

int main()
{
    int sockfd;
    struct sockaddr_in serv_addr;
    char buff[256];
    int n;

    // Socket creation
    sockfd = socket(AF_INET, SOCK_STREAM, 0);
    if (sockfd < 0)
        perror("Socket creation failed");
    return 0;
}

// Server listening
// Server accept the client...
// From client: Hello client here
// To client : hey server this side
{
    // and send that buffer to client
    write(sockfd, buff, sizeof(buff));

    // if msg contains "Exit" then server exit and chat ended.
    if (strcmp(buff, "Exit") == 0) {
        printf("Server Exit...\n");
        break;
    }
}
```

Problem Statement-2:

Write a C program to demonstrate both Zombie and Orphan process.

The screenshot shows a C program in a text editor and its execution in a terminal. The program uses `fork()` to create a child process. The parent process prints "First child is the Orphan." and "Child's child will be the Zombie here." before exiting. The child process prints "IN PARENT PROCESS" and "MY PROCESS ID: 5028". The grandchild process prints "CHILD PROCESS ID : 5029", "NEW PARENT PROCESS ID : 1208", and "IN CHILD'S CHILD PARENT PROCESS ID : 5029".

```
#include <stdio.h>
#include <stdlib.h>
#include <sys/types.h>
#include <sys/stat.h>
#include <error.h>
#include <signal.h>
#include <unistd.h>
#include <syslog.h>
int main()
{
    printf("First child is the Orphan.\n");
    int x;
    x = fork();

    if (x > 0)
        printf("IN PARENT PROCESS\nMY PROCESS ID: 5028\n");

    else if (x == 0) {
        sleep(5);
        x = fork();

        if (x > 0) {
            printf("CHILD PROCESS ID : 5029\nNEW PARENT PROCESS ID : 1208\nIN CHILD'S CHILD PARENT PROCESS ID : 5029\n");
        }
        else if (x == 0)
            printf("IN CHILD'S CHILD PARENT PROCESS ID : 5029\n", getpid());
    }

    return 0;
}
```

```
hemantsingh@hemantsingh: ~/Desktop
File Edit View Search Terminal Help
hemantsingh@hemantsingh:~/Desktop$ ./a.out
First child is the Orphan.
Child's child will be the Zombie here.
IN PARENT PROCESS
MY PROCESS ID: 5028
hemantsingh@hemantsingh:~/Desktop$ CHILD PROCESS ID : 5029
NEW PARENT PROCESS ID : 1208
IN CHILD'S CHILD PARENT PROCESS ID : 5029
```
